

# Risk Stratification for Amputation in Patients with Symptomatic Peripheral Artery Disease After Lower Extremity Revascularization: Insights from VOYAGER PAD

R. Wilson King MD, Mark Nehler MD, Sebastian Debus MD, Manesh Patel MD, Sonia Anand MD, Connie Hess MD, Warren Capell MD, Lars Norgren, MD, Matthew Menard MD, Judith Hsia MD, Joe Ycas PhD, Michael Szarek, PhD, Eva Muehlhofer, Lloyd Haskell MD, Scott Berkowitz MD, Rupert Bauersachs MD,

Marc Bonaca MD, MPH

Scientific Sessions of the American College of Cardiology
April 7, 2024

### **Risk Stratification in PAD**

 Patients with PAD are at heterogenous risk of adverse limb events and specifically amputation

 Patient characteristics (e.g. diabetes mellitus) as well as limb/wound factors have been shown to be associated with amputation risk

 Risk stratification offers the opportunity to personalize assessment and the use of therapies to reduce the risk of amputation

# Amputation Risk independently elevated with microvascular disease

Beckman et al. Microvascular Disease, PAD, and

Behan...Bonaca et al. Impact of Polyvascular Disease and Diabetes on Limb and Cardiovascular Risk in Peripheral Artery Disease. JACC 2022

# The Rutherford Classification System

- Created in 1986
- Widely accepted
- Modified in 1997
  - Objective measures

Rutherford Stage	Signs and Symptoms
0	Asymptomatic
1	Mild claudication
2	Moderate claudication
3	Severe claudication
4	Rest pain
5	Ischemic ulcers of digits
6	Severe ischemic ulcers or gangrene

Rutherford R Bet al. Suggested standards for reports dealing with lower extremity ischemia. JVS 1986

### Wlfl – Wound Ischemia Foot Infection

**Table 7.** Assessment of the risk of amputation: the WIFI classification (for further details see Mills et  $al^{317}$ ).

		1005						
Component	Score	Description						
NAZ	0	No ulcer (ischaer	nic rest pain)					
W	1	Small, shallow ul	cer on distal leg or foot without gangre	ene				
(Wound)	2	Deeper ulcer wit	n exposed bone, joint or tendon $\pm$ gan	grenous changes limited to toes				
	3	Extensive deep u	lcer, full thickness heel ulcer $\pm$ calcane	al involvement $\pm$ extensive gangrene				
		ABI	Ankle pressure (mmHg)	Toe pressure or TcPO <sub>2</sub>				
	0	≥0.80	> 100	≥60				
(Ischaemia)	1	0.60 - 0.79	70-100	40-59				
	2	0.40-0.59	50-70	30-39				
	3	< 0.40	<50	<30				
CI.	0	No symptoms/sig	ns of infection					
41	1	Local infection in	Local infection involving only skin and subcutaneous tissue					
(foot Infection)	2	Local infection in	volving deeper than skin/subcutaneous	tissue				
	3	Systemic inflamm	atory response syndrome					

Mills, Conte, et al. The Society for Vascular Surgery Lower Extremity Threatened Limb Classification System...JVS 2014

# Wlfl – Stratified in clinical stages

### Risk of major amputation at one year

	Ischemia - 0				Ischemia - 1	Ischemia - 1				
W-0	VL	VL	L	M	VL	L	M	Н

	fI-O	fl-1	fi-2	fi-3	fi-0	fi-1	fi-2	fi-3		

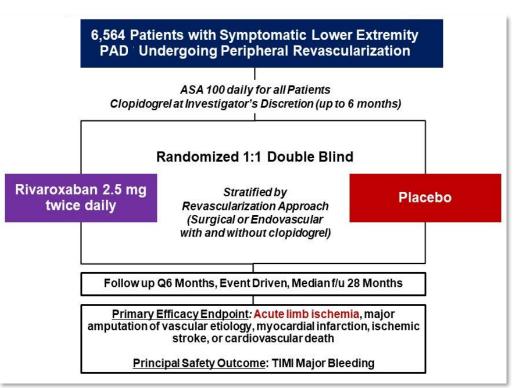

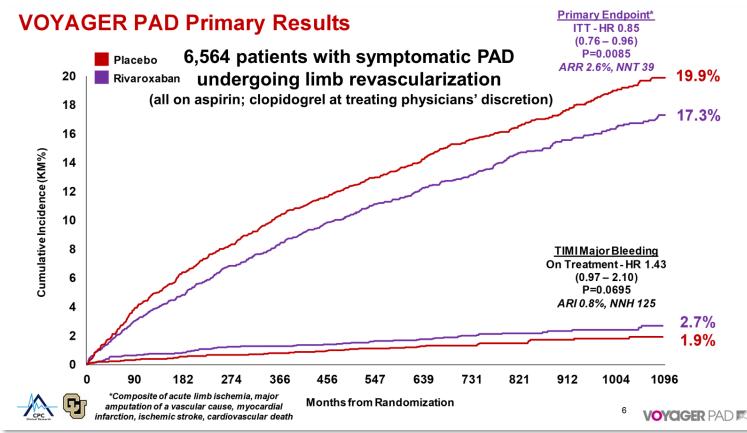

# Hypothesis using VOYAGER PAD population

- Evaluate risk of amputation (major and minor)
  - Baseline Rutherford
  - Baseline Wlfl
  - Adding comorbid diabetes
- Examine the risk of minor and major amputation post LER stratified by baseline Rutherford and Wlfl score
- Determine whether the addition of comorbid diabetes to baseline Wlfl could strengthen the prediction model

## **VOYAGER PAD**

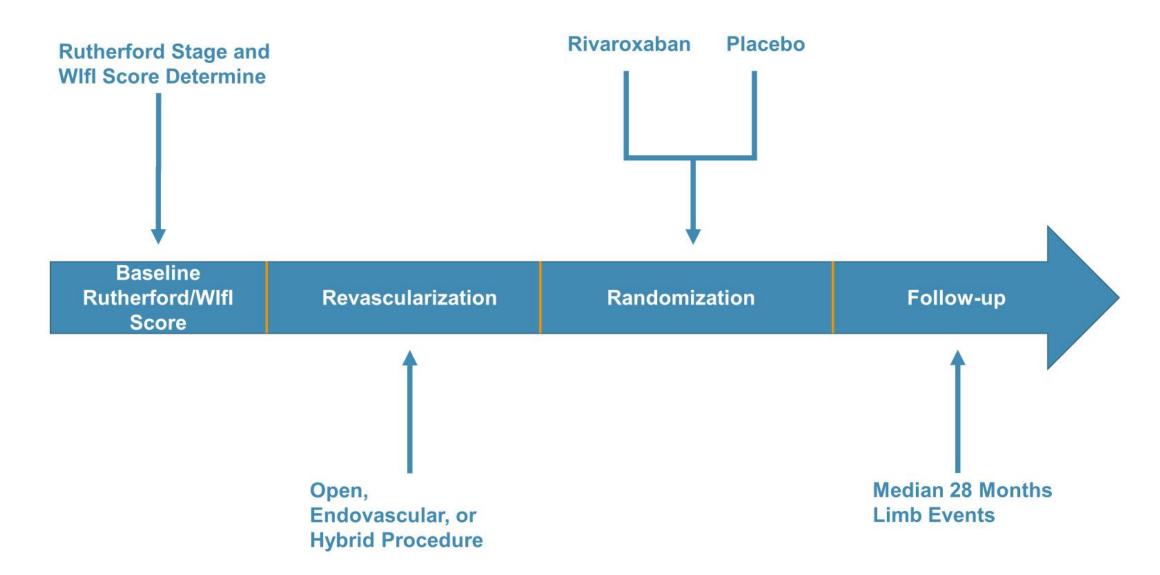

### **Methods**

- VOYAGER PAD population
  - Baseline Rutherford stage and Wlfl scores recorded
  - Baseline Wlfl stratified by presence of diabetes mellitus
  - Novel modified DM-Wlfl score created
  - Amputation incidence (major and minor) at 3 years determined and risk stratified by these different risk prediction systems

# **Why Diabetes?**

	% VOYAGER ITT population
Type 2 DM	38%
Female	26%
Smoking (current/former)	80%
Prior amputation	6%
Statin use ay baseline	80%

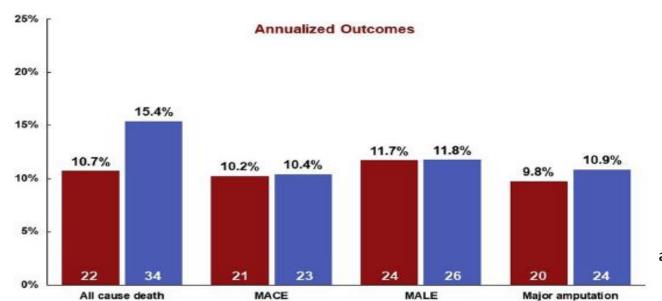

### Analysis of Maximum Likelihood Estimates

Parameter	DF	Estimate	Standard Error	Wald Chi-Square	Pr > ChiSq
Age	1	-0.0106	0.00592	3.2329	0.0722
DM II	1	0.9105	0.0978	86.6618	<.0001
Gender	1	0.0690	0.1134	0.3701	0.5430
Ever Smoking	1	-0.1252	0.1211	1.0683	0.3013
Statin baseline	1	-0.2291	0.1159	3.9075	0.0481
Prior amputation	1	0.000679	0.00358	0.0361	0.8494

### **Incidence of All Amputations by Modified-DM WIFI Score at 3 Years**

### Incidence of All Amputations by Modified-DM WIfI Score at 3 Years

### Conclusion

- Stratifying amputation risk
  - Rutherford significantly associated with future amputation risk even after successful revascularization

- Wlfl associated with amputation risk, however, when stratified by Diabetes Mellitus, risk is increased across categories
- A Novel DM-Wlfl score can stratify risk in a different manner by including comorbid diabetes. This may make risk labels more appropriate and offer a more complete picture for our patients with diabetes.
